Summary

`{rempsysc}` is an R package of convenience functions that make the analysis-to-publication workflow faster, easier, and less error-prone. It affords easily customizable APA plots (via `{ggplot2}`) and nice APA tables exportable to Word (via `{flectable}`). It makes it easy to run statistical tests, check assumptions, and automatize various tasks. It is a package mostly geared at researchers in the psychological sciences but people from all fields can benefit from it.

Statement of need

There are many reasons to use R ([R Core Team 2022](#)) for analyzing and reporting data from research studies. R is more compatible with the ideals of open science ([Quintana 2020](#)). In contrast to commercial software: (a) it is free to use; (b) it makes it easy to share a fully comprehensive analysis script; (c) it is transparent as anyone can look at the formulas or algorithms used in a given package; (d) the community can quickly contribute new packages based on current needs; (e) it generates better-looking figures; and (f) it helps reduce copy-paste errors so common in psychology. The latter point is a substantial one because according to some estimates, up to 50% of articles in psychology have at least one statistical error ([Nuijten et al. 2016](#)).

However, R has a major downside for R novices: its steep learning curve due to its programmatic interface, in contrast to perhaps more user-friendly point-and-click software. Of course, this flexibility is also a strength, as the R community can, and increasingly does, mobilize to produce packages that make using R as easy as possible (e.g., the *easystats* ecosystem [Lüdtke et al. \[2019\] 2023](#)). The `{rempsysc}` package contributes to this momentum by providing convenience functions that remove as much friction as possible between your script and your manuscript (in particular, if you are using Microsoft Word).

There are mainly three things that go into a manuscript: text, tables, and figures. `{rempsysc}` does not generate publication-ready text summarizing analyses; for this, see the `{report}` package ([Makowski et al. \[2021\] 2023](#)). Instead, `{rempsysc}` focuses on the production of publication-ready tables and figures. Below, I go over a few quick examples of those.

Examples Features

Publication-Ready Tables

Formatting your table properly in R is already a time-consuming task, but fortunately several packages take care of the formatting within R [e.g., the `{broom}` or `{report}` packages, Robinson, Hayes, and Couch (2022); Makowski et al. ([2021] 2023); and there are several others]. Exporting these formatted tables to Microsoft Word remains a challenge however.

38 Some packages do export to Word (e.g., [Stanley and Spence 2018](#)), but their formatting is
39 often rigid especially when using analyzes that are not supported by default.

40 {rempsysc} solves this problem by allowing maximum flexibility: you manually create the data
41 frame exactly the way you want, and then only use the magical function, nice_table(), on
42 the resulting data frame. nice_table() works on any data frame, even non-statistical ones.
43 For example, it will work on the mtcars data set.

```
44 library(rempsysc)
```

```
45
```

```
46 nice_table(
```

```
47   mtcars[1:3, ],
```

```
48   title = c("Table 1", "Motor Trend Car Road Tests"),
```

```
49   note = c("The data was extracted from the 1974 Motor Trend US magazine.",
```

```
50             "* p < .05, ** p < .01, *** p < .001"))
```

51 One of its main benefit however is the automatic formatting of statistical symbols and its
52 integration with other packages. We can for example create a {broom} table and then apply
53 nice_table() on it. It suits particularly well the pipe workflow.

```
54 library(broom)
```

```
55 model <- lm(mpg ~ cyl + wt * hp, mtcars)
```

```
56 tidy(model, conf.int = TRUE) |>
```

```
57   nice_table(broom = "lm")
```

Term	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	95% CI
<hr/>					
(Intercept)	49.49	3.66	13.51	< .001	[41.97, 57.01]
cyl	-0.37	0.51	-0.72	.479	[-1.41, 0.68]
wt	-7.63	1.52	-5.01	< .001	[-10.75, -4.51]
hp	-0.11	0.03	-3.64	.001	[-0.17, -0.05]
wt × hp	0.03	0.01	3.23	.003	[0.01, 0.04]

```
58
```

59 We can do the same with a {report} table.

```
60 library(report)
```

```
61 model <- lm(mpg ~ cyl + wt * hp, mtcars)
```

```
62 stats.table <- as.data.frame(report(model))
```

```
63
```

```
64 nice_table(stats.table)
```

Parameter	Fit	<i>b</i>	95% CI (<i>b</i>)	<i>t</i>	<i>df</i>	<i>p</i>	β	95% CI (β)
(Intercept)		49.49	[41.97, 57.01]	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl		-0.37	[-1.41, 0.68]	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt		-7.63	[-10.75, -4.51]	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp		-0.11	[-0.17, -0.05]	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp		0.03	[0.01, 0.04]	3.23	27	.003	0.29	[0.11, 0.47]
AIC	147.01							
AICc	150.37							
BIC	155.80							
R2	0.89							
R2 (adj.)	0.87							
Sigma	2.17							

65

66 The `{report}` package provides quite comprehensive tables, so one may request an abbreviated
67 table with the `short` argument.

68 `nice_table(stats.table, short = TRUE)`

Parameter	<i>b</i>	<i>t</i>	<i>df</i>	<i>p</i>	β	95% CI (β)
(Intercept)	49.49	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl	-0.37	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt	-7.63	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp	-0.11	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp	0.03	3.23	27	.003	0.29	[0.11, 0.47]

69

70 For convenience, it is also possible to highlight significant results for better visual discrimination,
71 using the highlight argument[1].

72 my_table <- nice_table(stats.table, short = TRUE, highlight = 0.001)

73 my_table

Parameter	<i>b</i>	<i>t</i>	<i>df</i>	<i>p</i>	β	95% CI (β)
(Intercept)	49.49	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl	-0.37	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt	-7.63	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp	-0.11	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp	0.03	3.23	27	.003	0.29	[0.11, 0.47]

74

75 One can easily save the resulting table to Word with `flextable::save_as_docx()`, specifying
76 the object name and desired path.

77 `flextable::save_as_docx(my_table, path = "nice_tablehere.docx")`

78 Additionally, tables created with `nice_table()` are {flextable} objects (Gohel and Skintzos

79 [2022](#)), and can be modified as such[2].

80 **Formattting Results of Analyses**

81 {rempsyc} also provides its own set of functions to prepare statistical tables before they can be
82 fed to nice_table() and saved to Word.

83 **t tests**

```
84 nice_t_test(data = mtcars,  
85             response = c("mpg", "disp", "drat"),  
86             group = "am",  
87             warning = FALSE) |>  
88 nice_table()
```

Dependent Variable	<i>t</i>	<i>df</i>	<i>p</i>	<i>d</i>	95% CI
mpg	-3.77	18.33	.001	-1.48	[-2.27, -0.67]
disp	4.20	29.26	< .001	1.45	[0.64, 2.23]
drat	-5.65	27.20	< .001	-2.00	[-2.86, -1.12]

89

90 **Contrasts**

```
91 nice_contrasts(data = mtcars,  
92                response = c("mpg", "disp"),  
93                group = "cyl",  
94                covariates = "hp") |>  
95 nice_table(highlight = .001)
```

Dependent Variable	Comparison	df	t	p	d	95% CI
mpg	4 - 8	28	3.66	.001	3.59	[2.70, 4.48]
	6 - 8	28	1.29	.207	1.44	[0.82, 1.97]
	4 - 6	28	3.64	.001	2.15	[1.37, 3.03]
disp	4 - 8	28	-6.04	< .001	-4.80	[-5.82, -3.97]
	6 - 8	28	-4.86	< .001	-3.29	[-4.36, -2.33]
	4 - 6	28	-2.70	.012	-1.51	[-2.23, -0.90]

96

97 Moderations

```
98 nice_mod(data = mtcars,
99           response = "mpg",
100            predictor = "gear",
101            moderator = "wt") |>
102 nice_table()
```

Dependent Variable	Predictor	df	b	t	p	sr ²	95% CI
mpg	gear	28	5.62	1.94	.062	.03	[0.00, 0.08]
	wt	28	1.40	0.43	.670	.00	[0.00, 0.01]
	gear × wt	28	-1.97	-2.16	.040	.04	[0.00, 0.10]

103

104 Regressions

```
105 model1 <- lm(mpg ~ cyl + wt * hp, mtcars)
106 model2 <- lm(qsec ~ disp + drat * carb, mtcars)
107
108 nice_lm(list(model1, model2)) |>
109 nice_table(highlight = TRUE)
```

Dependent Variable	Predictor	<i>df</i>	<i>b</i>	<i>t</i>	<i>p</i>	<i>sr</i> ²	95% CI
mpg	cyl	27	-0.37	-0.72	.479	.00	[0.00, 0.01]
	wt	27	-7.63	-5.01	< .001	.11	[0.01, 0.20]
	hp	27	-0.11	-3.64	.001	.06	[0.00, 0.12]
	wt × hp	27	0.03	3.23	.003	.04	[0.00, 0.10]
qsec	disp	27	-0.01	-1.97	.059	.07	[0.00, 0.20]
	drat	27	0.23	0.20	.845	.00	[0.00, 0.01]
	carb	27	1.15	0.72	.479	.01	[0.00, 0.06]
	drat × carb	27	-0.48	-1.08	.289	.02	[0.00, 0.09]

110

111 Simple Slopes

```

112 model1 <- lm(mpg ~ gear * wt, mtcars)
113 model2 <- lm(disp ~ gear * wt, mtcars)
114 my.models <- list(model1, model2)
115
116 nice_lm_slopes(my.models, predictor = "gear", moderator = "wt") |>
117   nice_table()
```

Dependent Variable	Predictor (+/-1 <i>SD</i>)	<i>df</i>	<i>b</i>	<i>t</i>	<i>p</i>	<i>sr</i> ²	95% CI
mpg	gear (LOW-wt)	28	7.54	2.01	.054	.03	[0.00, 0.09]
	gear (MEAN-wt)	28	5.62	1.94	.062	.03	[0.00, 0.08]
	gear (HIGH-wt)	28	3.69	1.80	.083	.02	[0.00, 0.08]
disp	gear (LOW-wt)	28	50.51	0.67	.511	.00	[0.00, 0.02]
	gear (MEAN-wt)	28	35.80	0.61	.545	.00	[0.00, 0.02]
	gear (HIGH-wt)	28	21.08	0.51	.616	.00	[0.00, 0.02]

118

119 Correlation Matrix

120 It is also possible to export a colour-coded correlation matrix to Microsoft Excel. The
121 `cormatrix_excel()` function has several benefits over conventional approaches. The base R
122 `cor()` function for example does not use rounded values and the console is impractical for
123 large matrices. One may manually round values and export it to a .csv file, which is an
124 improvement but still unsatisfying.

125 The `{apaTables}` package (Stanley and Spence 2018) allows exporting the correlation matrix
126 to Word in an APA format, and in many cases this is very satisfying for APA requirements.
127 However, the Word format is not suitable for large matrices, as it will often spread beyond the
128 document's margin limits.

129 Another approach is to export to an image, like `{correlation}` package does (Makowski et
130 al. 2020). For very small matrices, this works extremely well, and the colour is an immense help
131 to quickly identify which correlations are strong or weak, positive or negative. Again, however,
132 this does not work so well for large matrices because labels might overlap or navigating the
133 large figure becomes difficult.

134 When the goal is more exploratory, rather than reporting, and we have large matrices, it can
135 be more useful to export it to Excel. In `{rempsyc}`, we combine the idea of using a coloured
136 correlation matrix from the `{correlation}` package with the idea of exporting to Excel using
137 `{openxlsx2}` (Barbone and Garbuszus 2023).

138 We also provide some quality of life-improvements, like freezing the first row and column so as
139 to be able to easily see to which variables the correlations relate, regardless of how far or deep
140 we are within the large correlation matrix.

141 The colour represents the strength of the correlation, whereas the stars represent how significant
142 the p value is.[3] The exact p values are provided in a second tab for reference purposes, so all
143 information is readily available in a convenient format.

```
144 cormatrix_excel(data = infert,  
145                 filename = "cormatrix1",  
146                 select = c("age", "parity", "induced", "case", "spontaneous",  
147                           "stratum", "pooled.stratum"))
```

	A	B	C	D	E	F	G	H	I
1	Parameter	age	parity	induced	case	spontaneous	stratum	pooled.stratum	
2	age	1.0	.08	-.10	.0	-.08	-.21 ***	-.17 *	
3	parity	.08	1.0	.45 ***	.01	.31 ***	-.31 ***	.12	
4	induced	-.10	.45 ***	1.0	.02	-.27 ***	-.10	.16 *	
5	case	.0	.01	.02	1.0	.36 ***	.0	.0	
6	spontaneous	-.08	.31 ***	-.27 ***	.36 ***	1.0	.06	.21 ***	
7	stratum	-.21 ***	-.31 ***	-.10	.0	.06	1.0	.75 ***	
8	pooled.stratum	-.17 *	.12	.16 *	.0	.21 ***	.75 ***	1.0

149

Publication-Ready Figures

150

151 Preparing figures according to APA style, having them look good, and being able to save
152 them in high-resolution with the proper ratios is often challenging. Working with {ggplot2}
153 (Wickham 2016) provides tremendous flexibility, but an unintended consequence is that doing
154 even trivial operations can at times be daunting.

155 This is why {rempsyc} prepares a few plot types for you, so they are ready to be saved to your
156 preferred format (.pdf, .tiff, or .png).

Violin Plots

157

```
158 nice_violin(data = ToothGrowth,
159             group = "dose",
160             response = "len",
161             xlabels = c("Low", "Medium", "High"),
162             comp1 = 1,
163             comp2 = 3,
164             has.d = TRUE,
165             d.y = 30)
```

166

167 For an example of such use in publication, see Thériault et al. (2021).

168 One can easily save the resulting figure with `ggplot2::ggsave()`, specifying the desired file
169 name, extension, and resolution.

```
170 ggplot2::ggsave('nice_violinplotthere.pdf', width = 7, height = 7,  
171                unit = 'in', dpi = 300)
```

172 Recommended dimensions for saving {rempsyc} figures is 7 inches wide and 7 inches high
173 at 300 dpi, which makes sure that the resolution is high enough even if saving to non-vector
174 graphics formats like .png. That said, scalable vector graphics formats like .pdf or .eps are
175 still recommended for high-resolution submissions to scientific journals. Additionally, figures
176 are {ggplot2} objects (Wickham 2016), and can be modified as such.

177 Scatter Plots

178 For an example of such use in publication, see Krol et al. (2020).

```
179 nice_scatter(data = mtcars,  
180             predictor = "wt",  
181             response = "mpg",  
182             has.confband = TRUE,  
183             has.r = TRUE,  
184             has.p = TRUE)
```

```

185
186 nice_scatter(data = mtcars,
187               predictor = "wt",
188               response = "mpg",
189               group = "cyl",
190               has.confband = TRUE)

```

192 **Overlapping Circles**

193 For psychologists using the Inclusion of Other in the the Self Scale ([Aron, Aron, and Smollan 1992](#)), it can be useful to interpolate the original discrete scores (1 to 7) into a group average
194 representation of the conceptual self-other overlap. For an example of such use in publication,
195 see Thériault et al. ([2021](#)).

197 `overlap_circle(3.5)`

198

199 **Testing assumptions**

200 When comes time to test assumptions of a linear model, the best option is the `check_model()`
201 function from *easystats*' `{performance}` package, which allows direct visual evaluation of as-
202 sumptions ([Lüdtke et al. 2021](#)). Indeed, visual assessment of diagnostic plots is recommended
203 over statistical tests since they are overpowered in large samples and underpowered in small
204 samples ([Kozak and Piepho 2018](#)).

205 That said, if for whatever reason one wants to check objective assumption tests for a linear
206 model, *rempsysc* makes this easy with the `nice_assumptions()` function, which provide *p*
207 values for normality (Shapiro-Wilk), homoscedasticity (Breusch-Pagan) and autocorrelation of
208 residuals (Durbin-Watson) in one call. .

209 **Categorical Predictors**

210 `nice_normality()` makes it easy to visually check normality in the case of categorical predictors
211 (i.e., when using groups), through a combination of quantile-quantile plots, density plots, and
212 histograms.

```
213 nice_normality(data = iris,
214               variable = "Sepal.Length",
215               group = "Species",
216               shapiro = TRUE,
217               histogram = TRUE,
```

218

```
title = "Density (Sepal Length)")
```

Density (Sepal Length)

219

220 Similarly for univariate outliers using the median absolute deviation (MAD, [Leys et al. 2013](#)).

```
221 plot_outliers(airquality,  
222               group = "Month",  
223               response = "Ozone")
```

```
224  
225 ## Bin width defaults to 1/30 of the range of the data. Pick better value with  
226 ## `binwidth`.
```

227

```
228 ## Warning: Removed 37 rows containing missing values (`stat_bindot()`).
```

229

230 Univariate outliers based on the MAD can also be simply requested with `find_mad()[4]`

231 `find_mad(airquality, names(airquality), criteria = 3)`

232

233 `## 8 outlier(s) based on 3 median absolute deviations for variable(s):`

234 `## Ozone, Solar.R, Wind, Temp, Month, Day`

235 `##`

236 `## Outliers per variable:`

237 `##`

238 `## $Ozone`

239 `## Row Ozone_mad`

240 `## 1 30 3.218284`

241 `## 2 62 3.989131`

242 `## 3 99 3.488081`

243 `## 4 101 3.025573`

244 `## 5 117 5.261028`

245 `## 6 121 3.333911`

246 `##`

247 `## $Wind`

248 `## Row Wind_mad`

249 `## 1 9 3.049871`

250 `## 2 48 3.225825`

251 Homoscedasticity can also be checked numerically with `nice_var()` or visually with
252 `nice_varplot()`.

253 `nice_var(data = iris,`
254 `variable = names(iris[1:4]),`
255 `group = "Species")`

256

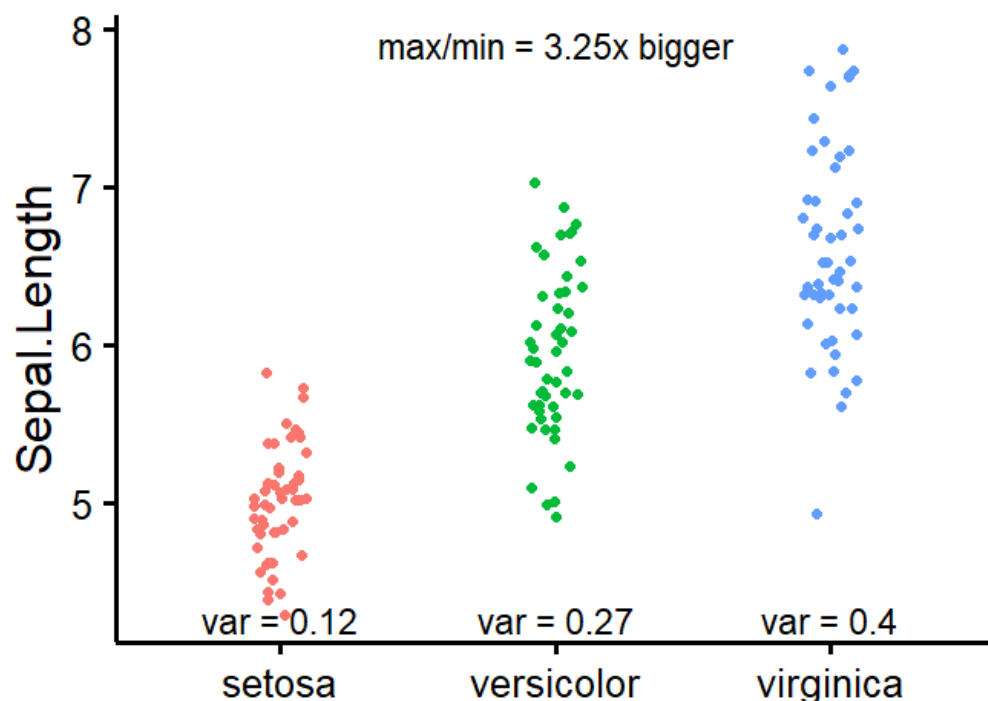

257 `## Species Setosa Versicolor Virginica Variance.ratio Criteria`

258 `## 1 Sepal.Length 0.124 0.266 0.404 3.3 4`

```

259 ## 2 Sepal.Width 0.144      0.098      0.104          1.5          4
260 ## 3 Petal.Length 0.030      0.221      0.305         10.2          4
261 ## 4 Petal.Width 0.011      0.039      0.075          6.8          4
262 ## Heteroscedastic
263 ## 1 FALSE
264 ## 2 FALSE
265 ## 3 TRUE
266 ## 4 TRUE
267
268 nice_varplot(data = iris,
269              variable = "Sepal.Length",
270              group = "Species")

```

Utility functions

Finally, with the idea of making the analysis workflow easier in mind, {rempsyc} also has a few other utility functions. `nice_na()` allows reporting item-level missing values per scale, as well as participant's maximum number of missing items by scale, as per recommendations (Parent 2013).

`extract_duplicates()` creates a data frame of only observations with a duplicated ID or participant number, so they can be investigated more thoroughly. `best_duplicate()` allows to follow-up on this investigation and only keep the "best" duplicate, meaning those with the fewer number of missing values, and in case of ties, the first one.

`nice_reverse()` permits the automatic reverse-coding of scores so common for psychology questionnaires, provided the minimum and maximum score values are known.

There are other functions that the reader can explore at their leisure on the package official website. However, hopefully, this overview has given the reader a gentle introduction to this package.

286 Availability

287 The {rempsyc} package is available on CRAN, and can be installed using `install.packages("rempsyc")`.
288 The full tutorial website can be accessed at: <https://rempsyc.remi-theriault.com/>.

289 Acknowledgements

290 I would like to thank Hugues Leduc, Jay Olson, Charles-Étienne Lavoie, and Björn Büdenbender
291 for statistical or technical advice that helped inform some functions of this package and/or
292 useful feedback on this manuscript. I would also like to acknowledge funding from the Social
293 Sciences and Humanities Research Council of Canada.
