Summary

`{rempsysc}` is an R package of convenience functions that make the analysis-to-publication workflow faster, easier, and less error-prone. It affords easily customizable APA plots (via `{ggplot2}`) and nice APA tables exportable to Word (via `{flectable}`). It makes it easy to run statistical tests, check assumptions, and automatize various tasks. It is a package mostly geared at researchers in the psychological sciences but people from all fields can benefit from it.

Statement of need

There are many reasons to use R ([R Core Team 2022](#)) for analyzing and reporting data from research studies. R is more compatible with the ideals of open science ([Quintana 2020](#)). In contrast to commercial software: (a) it is free to use; (b) it makes it easy to share a fully comprehensive analysis script; (c) it is transparent as anyone can look at the formulas or algorithms used in a given package; (d) the community can quickly contribute new packages based on current needs; (e) it generates better-looking figures; and (f) it helps reduce copy-paste errors so common in psychology. The latter point is a substantial one because according to some estimates, up to 50% of articles in psychology have at least one statistical error ([Nuijten et al. 2016](#)).

However, R has a major downside for R novices: its steep learning curve due to its programmatic interface, in contrast to perhaps more user-friendly point-and-click software. Of course, this flexibility is also a strength, as the R community can, and increasingly does, mobilize to produce packages that make using R as easy as possible (e.g., the *easystats* ecosystem [Lüdtke et al. \[2019\] 2023](#)). The `{rempsysc}` package contributes to this momentum by providing convenience functions that remove as much friction as possible between your script and your manuscript (in particular, if you are using Microsoft Word).

There are mainly three things that go into a manuscript: text, tables, and figures. `{rempsysc}` does not generate publication-ready text summarizing analyses; for this, see the `{report}` package ([Makowski et al. \[2021\] 2023](#)). Instead, `{rempsysc}` focuses on the production of publication-ready tables and figures. Below, I go over a few quick examples of those.

Examples Features

Publication-Ready Tables

Formatting your table properly in R is already a time-consuming task, but fortunately several packages take care of the formatting within R [e.g., the `{broom}` or `{report}` packages, Robinson, Hayes, and Couch (2022); Makowski et al. ([2021] 2023); and there are several others]. Exporting these formatted tables to Microsoft Word remains a challenge however.

38 Some packages do export to Word (e.g., [Stanley and Spence 2018](#)), but their formatting is
39 often rigid especially when using analyzes that are not supported by default.

40 {rempsysc} solves this problem by allowing maximum flexibility: you manually create the data
41 frame exactly the way you want, and then only use the magical function, nice_table(), on
42 the resulting data frame. nice_table() works on any data frame, even non-statistical ones.
43 For example, it will work on the mtcars data set.

```
44 library(rempsysc)
45
46 nice_table(
47   mtcars[1:3, ],
48   title = c("Table 1", "Motor Trend Car Road Tests"),
49   note = c("The data was extracted from the 1974 Motor Trend US magazine.",
50           "* p < .05, ** p < .01, *** p < .001"))
```

Table 1

Motor Trend Car Road Tests

mpg	cyl	disp	hp	drat	wt	qsec	vs	am	gear	carb
21.00	6.00	160.00	110.00	3.90	2.62	16.46	0.00	1.00	4.00	4.00
21.00	6.00	160.00	110.00	3.90	2.88	17.02	0.00	1.00	4.00	4.00
22.80	4.00	108.00	93.00	3.85	2.32	18.61	1.00	1.00	4.00	1.00

Note. The data was extracted from the 1974 Motor Trend US magazine.

* p < .05, ** p < .01, *** p < .001

51

52 A nice image.

53 One of its main benefit however is the automatic formatting of statistical symbols and its
54 integration with other packages. We can for example create a {broom} table and then apply
55 nice_table() on it. It suits particularly well the pipe workflow.

```
56 library(broom)
57 model <- lm(mpg ~ cyl + wt * hp, mtcars)
58 tidy(model, conf.int = TRUE) |>
59   nice_table(broom = "lm")
```

Term	<i>b</i>	<i>SE</i>	<i>t</i>	<i>p</i>	95% CI
(Intercept)	49.49	3.66	13.51	< .001	[41.97, 57.01]
cyl	-0.37	0.51	-0.72	.479	[-1.41, 0.68]
wt	-7.63	1.52	-5.01	< .001	[-10.75, -4.51]
hp	-0.11	0.03	-3.64	.001	[-0.17, -0.05]
wt × hp	0.03	0.01	3.23	.003	[0.01, 0.04]

```

60
61 We can do the same with a {report} table.
62 library(report)
63 model <- lm(mpg ~ cyl + wt * hp, mtcars)
64 stats.table <- as.data.frame(report(model))
65
66 nice_table(stats.table)

```

Parameter	Fit	b	95% CI (b)	t	df	p	β	95% CI (β)
(Intercept)		49.49	[41.97, 57.01]	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl		-0.37	[-1.41, 0.68]	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt		-7.63	[-10.75, -4.51]	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp		-0.11	[-0.17, -0.05]	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp		0.03	[0.01, 0.04]	3.23	27	.003	0.29	[0.11, 0.47]
AIC	147.01							
AICc	150.37							
BIC	155.80							
R2	0.89							
R2 (adj.)	0.87							
Sigma	2.17							

67

68 The `{report}` package provides quite comprehensive tables, so one may request an abbreviated
69 table with the `short` argument.

70 `nice_table(stats.table, short = TRUE)`

Parameter	<i>b</i>	<i>t</i>	<i>df</i>	<i>p</i>	β	95% CI (β)
(Intercept)	49.49	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl	-0.37	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt	-7.63	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp	-0.11	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp	0.03	3.23	27	.003	0.29	[0.11, 0.47]

71

72 For convenience, it is also possible to highlight significant results for better visual discrimination,
73 using the highlight argument[1].

74 my_table <- nice_table(stats.table, short = TRUE, highlight = 0.001)

75 my_table

Parameter	<i>b</i>	<i>t</i>	<i>df</i>	<i>p</i>	β	95% CI (β)
(Intercept)	49.49	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl	-0.37	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt	-7.63	-5.01	27	< .001	-0.62	[-0.85, -0.40]
hp	-0.11	-3.64	27	.001	-0.29	[-0.53, -0.04]
wt \times hp	0.03	3.23	27	.003	0.29	[0.11, 0.47]

76

77 One can easily save the resulting table to Word with `flextable::save_as_docx()`, specifying
78 the object name and desired path.

79 `flextable::save_as_docx(my_table, path = "nice_tablehere.docx")`

80 Additionally, tables created with `nice_table()` are {flextable} objects (Gohel and Skintzos

81 [2022](#)), and can be modified as such[2].

82 **Formattting Results of Analyses**

83 {rempsyc} also provides its own set of functions to prepare statistical tables before they can be
84 fed to nice_table() and saved to Word.

85 **t tests**

```
86 nice_t_test(data = mtcars,  
87             response = c("mpg", "disp", "drat"),  
88             group = "am",  
89             warning = FALSE) |>  
90 nice_table()
```

Dependent Variable	<i>t</i>	<i>df</i>	<i>p</i>	<i>d</i>	95% CI
mpg	-3.77	18.33	.001	-1.48	[-2.27, -0.67]
disp	4.20	29.26	< .001	1.45	[0.64, 2.23]
drat	-5.65	27.20	< .001	-2.00	[-2.86, -1.12]

91

92 **Contrasts**

```
93 nice_contrasts(data = mtcars,  
94                response = c("mpg", "disp"),  
95                group = "cyl",  
96                covariates = "hp") |>  
97 nice_table(highlight = .001)
```

Dependent Variable	Comparison	<i>df</i>	<i>t</i>	<i>p</i>	<i>d</i>	95% CI
mpg	4 - 8	28	3.66	.001	3.59	[2.70, 4.48]
	6 - 8	28	1.29	.207	1.44	[0.81, 1.97]
	4 - 6	28	3.64	.001	2.15	[1.38, 3.07]
disp	4 - 8	28	-6.04	< .001	-4.80	[-5.75, -3.85]
	6 - 8	28	-4.86	< .001	-3.29	[-4.34, -2.32]
	4 - 6	28	-2.70	.012	-1.51	[-2.30, -0.88]

98

99 Moderations

```
100 nice_mod(data = mtcars,
101           response = "mpg",
102           predictor = "gear",
103           moderator = "wt") |>
104 nice_table()
```

Dependent Variable	Predictor	<i>df</i>	<i>b</i>	<i>t</i>	<i>p</i>	<i>sr</i> ²	95% CI
mpg	gear	28	5.62	1.94	.062	.03	[0.00, 0.08]
	wt	28	1.40	0.43	.670	.00	[0.00, 0.01]
	gear × wt	28	-1.97	-2.16	.040	.04	[0.00, 0.10]

105

106 Regressions

```
107 model1 <- lm(mpg ~ cyl + wt * hp, mtcars)
108 model2 <- lm(qsec ~ disp + drat * carb, mtcars)
109
110 nice_lm(list(model1, model2)) |>
111 nice_table(highlight = TRUE)
```

Dependent Variable	Predictor	<i>df</i>	<i>b</i>	<i>t</i>	<i>p</i>	<i>sr</i> ²	95% CI
mpg	cyl	27	-0.37	-0.72	.479	.00	[0.00, 0.01]
	wt	27	-7.63	-5.01	<.001	.11	[0.01, 0.20]
	hp	27	-0.11	-3.64	.001	.06	[0.00, 0.12]
	wt × hp	27	0.03	3.23	.003	.04	[0.00, 0.10]
qsec	dis	27	-0.01	-1.97	.059	.07	[0.00, 0.20]
	drat	27	0.23	0.20	.845	.00	[0.00, 0.01]
	carb	27	1.15	0.72	.479	.01	[0.00, 0.06]
	drat × carb	27	-0.48	-1.08	.289	.02	[0.00, 0.09]

112

Simple Slopes

```

113
114 model1 <- lm(mpg ~ gear * wt, mtcars)
115 model2 <- lm(dis ~ gear * wt, mtcars)
116 my.models <- list(model1, model2)
117
118 nice_lm_slopes(my.models, predictor = "gear", moderator = "wt") |>
119   nice_table()
```

Dependent Variable	Predictor (+/-1 <i>SD</i>)	<i>df</i>	<i>b</i>	<i>t</i>	<i>p</i>	<i>sr</i> ²	95% CI
mpg	gear (LOW-wt)	28	7.54	2.01	.054	.03	[0.00, 0.09]
	gear (MEAN-wt)	28	5.62	1.94	.062	.03	[0.00, 0.08]
	gear (HIGH-wt)	28	3.69	1.80	.083	.02	[0.00, 0.08]
dis	gear (LOW-wt)	28	50.51	0.67	.511	.00	[0.00, 0.02]
	gear (MEAN-wt)	28	35.80	0.61	.545	.00	[0.00, 0.02]
	gear (HIGH-wt)	28	21.08	0.51	.616	.00	[0.00, 0.02]

120

121 Correlation Matrix

122 It is also possible to export a colour-coded correlation matrix to Microsoft Excel. The
123 `cormatrix_excel()` function has several benefits over conventional approaches. The base R
124 `cor()` function for example does not use rounded values and the console is impractical for
125 large matrices. One may manually round values and export it to a .csv file, which is an
126 improvement but still unsatisfying.

127 The `{apaTables}` package (Stanley and Spence 2018) allows exporting the correlation matrix
128 to Word in an APA format, and in many cases this is very satisfying for APA requirements.
129 However, the Word format is not suitable for large matrices, as it will often spread beyond the
130 document's margin limits.

131 Another approach is to export to an image, like `{correlation}` package does (Makowski et
132 al. 2020). For very small matrices, this works extremely well, and the colour is an immense help
133 to quickly identify which correlations are strong or weak, positive or negative. Again, however,
134 this does not work so well for large matrices because labels might overlap or navigating the
135 large figure becomes difficult.

136 When the goal is more exploratory, rather than reporting, and we have large matrices, it can
137 be more useful to export it to Excel. In `{rempsyc}`, we combine the idea of using a coloured
138 correlation matrix from the `{correlation}` package with the idea of exporting to Excel using
139 `{openxlsx2}` (Barbone and Garbuszus 2023).

140 We also provide some quality of life-improvements, like freezing the first row and column so as
141 to be able to easily see to which variables the correlations relate, regardless of how far or deep
142 we are within the large correlation matrix.

143 The colour represents the strength of the correlation, whereas the stars represent how significant
144 the p value is.[3] The exact p values are provided in a second tab for reference purposes, so all
145 information is readily available in a convenient format.

```
146 cormatrix_excel(data = infert,  
147                 filename = "cormatrix1",  
148                 select = c("age", "parity", "induced", "case", "spontaneous",  
149                           "stratum", "pooled.stratum"))
```

	A	B	C	D	E	F	G	H	I
1	Parameter	age	parity	induced	case	spontaneous	stratum	pooled.stratum	
2	age	1.0	.08	-.10	.0	-.08	-.21 ***	-.17 *	
3	parity	.08	1.0	.45 ***	.01	.31 ***	-.31 ***	.12	
4	induced	-.10	.45 ***	1.0	.02	-.27 ***	-.10	.16 *	
5	case	.0	.01	.02	1.0	.36 ***	.0	.0	
6	spontaneous	-.08	.31 ***	-.27 ***	.36 ***	1.0	.06	.21 ***	
7	stratum	-.21 ***	-.31 ***	-.10	.0	.06	1.0	.75 ***	
8	pooled.stratum	-.17 *	.12	.16 *	.0	.21 ***	.75 ***	1.0	
9

151

Publication-Ready Figures

152

153 Preparing figures according to APA style, having them look good, and being able to save
154 them in high-resolution with the proper ratios is often challenging. Working with {ggplot2}
155 ([Wickham 2016](#)) provides tremendous flexibility, but an unintended consequence is that doing
156 even trivial operations can at times be daunting.

157 This is why {rempsyc} prepares a few plot types for you, so they are ready to be saved to your
158 preferred format (.pdf, .tiff, or .png).

Violin Plots

159

```
160 nice_violin(data = ToothGrowth,  
161             group = "dose",  
162             response = "len",  
163             xlabels = c("Low", "Medium", "High"),  
164             comp1 = 1,  
165             comp2 = 3,  
166             has.d = TRUE,  
167             d.y = 30)
```

168 For an example of such use in publication, see Thériault et al. ([2021](#)).

169 One can easily save the resulting figure with ggplot2::ggsave(), specifying the desired file
170 name, extension, and resolution.

```
171 ggplot2::ggsave('nice_violinplotthere.pdf', width = 7, height = 7,  
172                unit = 'in', dpi = 300)
```

173 Recommended dimensions for saving {rempsyc} figures is 7 inches wide and 7 inches high
174 at 300 dpi, which makes sure that the resolution is high enough even if saving to non-vector
175 graphics formats like .png. That said, scalable vector graphics formats like .pdf or .eps are
176 still recommended for high-resolution submissions to scientific journals. Additionally, figures
177 are {ggplot2} objects ([Wickham 2016](#)), and can be modified as such.

Scatter Plots

178

179 For an example of such use in publication, see Krol et al. ([2020](#)).

```
180 nice_scatter(data = mtcars,  
181             predictor = "wt",  
182             response = "mpg",  
183             has.confband = TRUE,  
184             has.r = TRUE,  
185             has.p = TRUE)
```

```

186 nice_scatter(data = mtcars,
187               predictor = "wt",
188               response = "mpg",
189               group = "cyl",
190               has.confband = TRUE)

```

191 Overlapping Circles

192 For psychologists using the Inclusion of Other in the the Self Scale (Aron, Aron, and Smollan
 193 1992), it can be useful to interpolate the original discrete scores (1 to 7) into a group average
 194 representation of the conceptual self-other overlap. For an example of such use in publication,
 195 see Thériault et al. (2021).

```

196 overlap_circle(3.5)

```

197 Testing assumptions

198 When comes time to test assumptions of a linear model, the best option is the `check_model()`
 199 function from *easystats*' `{performance}` package, which allows direct visual evaluation of as-
 200 sumptions (Lüdtke et al. 2021). Indeed, visual assessment of diagnostic plots is recommended
 201 over statistical tests since they are overpowered in large samples and underpowered in small
 202 samples (Kozak and Piepho 2018).

203 That said, if for whatever reason one wants to check objective assumption tests for a linear
 204 model, *rempsysc* makes this easy with the `nice_assumptions()` function, which provide *p*
 205 values for normality (Shapiro-Wilk), homoscedasticity (Breusch-Pagan) and autocorrelation of
 206 residuals (Durbin-Watson) in one call. .

207 Categorical Predictors

208 `nice_normality()` makes it easy to visually check normality in the case of categorical predictors
 209 (i.e., when using groups), through a combination of quantile-quantile plots, density plots, and
 210 histograms.

```

211 nice_normality(data = iris,
212               variable = "Sepal.Length",
213               group = "Species",
214               shapiro = TRUE,
215               histogram = TRUE,
216               title = "Density (Sepal Length)")

```

217 Similarly for univariate outliers using the median absolute deviation (MAD, Leys et al. 2013).

```

218 plot_outliers(airquality,
219               group = "Month",
220               response = "Ozone")

```

```

222 ## Bin width defaults to 1/30 of the range of the data. Pick better value with
223 ## `binwidth`.

```

```

225 ## Warning: Removed 37 rows containing missing values (`stat_bindot()`).

```

226 Univariate outliers based on the MAD can also be simply requested with `find_mad()[4]`

```

227 find_mad(airquality, names(airquality), criteria = 3)

```

```

229 ## 8 outlier(s) based on 3 median absolute deviations for variable(s):
230 ##  Ozone, Solar.R, Wind, Temp, Month, Day
231 ##

```

```

232 ## Outliers per variable:
233 ##
234 ## $Ozone
235 ##   Row Ozone_mad
236 ## 1  30  3.218284
237 ## 2  62  3.989131
238 ## 3  99  3.488081

247 Homoscedasticity can also be checked numerically with nice_var() or visually with
248 nice_varplot().

249 nice_var(data = iris,
250           variable = names(iris[1:4]),
251           group = "Species")
252
253 ##           Species Setosa Versicolor Virginica Variance.ratio Criteria
254 ## 1 Sepal.Length  0.124      0.266      0.404           3.3          4
255 ## 2 Sepal.Width  0.144      0.098      0.104           1.5          4

257 ## 4 Petal.Width  0.011      0.039      0.075           6.8          4
258 ## Heteroscedastic
259 ## 1             FALSE
260 ## 2             FALSE
261 ## 3             TRUE
262 ## 4             TRUE
263
264 nice_varplot(data = iris,
265              variable = "Sepal.Length",
266              group = "Species")

267 Utility functions

268 Finally, with the idea of making the analysis workflow easier in mind, {rempsyc} also has a few
269 other utility functions. nice_na() allows reporting item-level missing values per scale, as well
270 as participant's maximum number of missing items by scale, as per recommendations (Parent
271 2013).

272 extract_duplicates() creates a data frame of only observations with a duplicated ID or
273 participant number, so they can be investigated more thoroughly. best_duplicate() allows to
274 follow-up on this investigation and only keep the “best” duplicate, meaning those with the
275 fewer number of missing values, and in case of ties, the first one.

276 nice_reverse() permits the automatic reverse-coding of scores so common for psychology
277 questionnaires, provided the minimum and maximum score values are known.

278 There are other functions that the reader can explore at their leisure on the package official
279 website. However, hopefully, this overview has given the reader a gentle introduction to this
280 package.

```

Availability

The {rempsysc} package is available on CRAN, and can be installed using `install.packages("rempsysc")`.
The full tutorial website can be accessed at: <https://rempsysc.remi-theriault.com/>.

Acknowledgements

I would like to thank Hugues Leduc, Jay Olson, Charles-Étienne Lavoie, and Björn Büdenbender for statistical or technical advice that helped inform some functions of this package and/or useful feedback on this manuscript. I would also like to acknowledge funding from the Social Sciences and Humanities Research Council of Canada.

- 340 [1] This argument can be used logically, as TRUE or FALSE, but can also be provided with a
341 numeric value representing the cut-off threshold for the p value
- 342 [2] A great resource for this is the {flextable} e-book: [https://ardata-fr.github.io/](https://ardata-fr.github.io/flextable-book/)
343 [flextable-book/](https://ardata-fr.github.io/flextable-book/)
- 344 [3] For convenience, colours are only used when the corresponding p value is at least smaller
345 than .05
- 346 [4] Once one has identified outliers, it is also possible to winsorize them with the
347 `winsorize_mad()` function.
