Summary

 $\{\text{rempsyc}\}\$ is an R package of convenience functions that make the analysis-to-publication workflow faster, easier, and less error-prone. It affords nice APA tables exportable to Word (via $\{\text{flextable}\}\)$) and easily customizable APA plots (via $\{\text{ggplot2}\}\)$). It makes it easy to run statistical tests, check assumptions, and automatize various tasks. It is a package mostly geared at researchers in the psychological sciences but people from all fields can benefit from it.

Statement of need

There are many reasons to use R (R Core Team. 2022) for analyzing and reporting data from research studies. R is more compatible with the ideals of open science (Quintana, 2020). In contrast to commercial software: (a) it is free to use; (b) it makes it easy to share a fully comprehensive analysis script; (c) it is transparent as anyone can look at the formulas or algorithms used in a given package; (d) the community can quickly contribute new packages based on current needs; (e) it generates better-looking figures; and (f) it helps reduce copypaste errors so common in psychology. The latter point is not trivial given that according to some estimates, up to 50% of articles in psychology have at least one statistical error (Nuijten et al., 2016).

However, R has a major downside for novices: its steep learning curve due to its programmatic interface, in contrast to perhaps more user-friendly point-and-click software. Of course, this flexibility is also a strength, as the R community can, and does, mobilize to produce packages that make using R increasingly easier (e.g., the *easystats* ecosystem Lüdecke et al., 2019/2023). The {rempsyc} package contributes to this momentum by providing convenience functions that remove as much friction as possible between your script and your manuscript (in particular, if you are using Microsoft Word).

There are mainly three things that go into a manuscript: text, tables, and figures. {rempsyc} does not generate publication-ready text summarizing analyses; for this, see the {report} package (Makowski et al., 2021/2023). Instead, {rempsyc} focuses on the production of publication-ready tables and figures. Below, I go over a few quick examples of those.

Examples Features

33 Publication-Ready Tables

Formatting your table properly in R is already a time-consuming task, but fortunately several packages take care of the formatting within R (Makowski et al., 2021/2023, and there are several others; e.g., the {broom} or {report} packages, Robinson et al., 2022). Exporting these formatted tables to Microsoft Word remains a challenge however. Some packages do

- export to Word (e.g., Stanley & Spence, 2018), but their formatting is often rigid especially when using analyzes that are not supported by default.
- 40 {rempsyc} solves this problem by allowing maximum flexibility: you manually create the data
- 41 frame exactly the way you want, and then only use the magical function, <code>nice_table()</code>, on
- the resulting data frame. nice_table() works on any data frame, even non-statistical ones
- 43 like mtcars.
- 44 One of its main benefit however is the automatic formatting of statistical symbols and its
- integration with other packages. We can for example create a {broom} table and then apply
- 46 nice_table() on it. It suits particularly well the pipe workflow.
- 47 library(rempsyc)
- 48 library(broom)

```
49
50 lm(mpg ~ cyl + wt * hp, mtcars) |>
51 tidy(conf.int = TRUE) |>
```

nice_table(broom = "lm")

Term	b	SE	t	p	95% CI
(Intercept)	49.49	3.66	13.51	<.001	[41.97, 57.01]
cyl	-0.37	0.51	-0.72	.479	[-1.41, 0.68]
wt	-7.63	1.52	-5.01	< .001	[-10.75, -4.51]
hp	-0.11	0.03	-3.64	.001	[-0.17, -0.05]
$\mathbf{wt} \times \mathbf{hp}$	0.03	0.01	3.23	.003	[0.01, 0.04]

We can do the same with a {report} table.

```
55 library(report)
```

```
56
57 stats.table <- lm(mpg ~ cyl + wt * hp, mtcars) |>
58 report() |>
59 as.data.frame()
```

61 nice_table(stats.table)

Parameter	Fit	b	95% CI (b)	t	df	p	β	95% CI (β)
(Intercept)		49.49	[41.97, 57.01]	13.51	27	< .001	-0.18	[-0.36, -0.01]
cyl		-0.37	[-1.41, 0.68]	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt		-7.63	[-10.75, -4.51]	-5.01	27	<.001	-0.62	[-0.85, -0.40]
hp		-0.11	[-0.17, -0.05]	-3.64	27	.001	-0.29	[-0.53, -0.04]
$\mathbf{wt} \times \mathbf{hp}$		0.03	[0.01, 0.04]	3.23	27	.003	0.29	[0.11, 0.47]
AIC	147.01							
AICc	150.37							
BIC	155.80							
R2	0.89							
R2 (adj.)	0.87							
Sigma	2.17							

The {report} package provides quite comprehensive tables, so one may request an abbreviated table with the 'short' argument. For convenience, it is also possible to highlight significant results for better visual discrimination, using the 'highlight' argument[1]. Once satisfied with the table, we can add a title and note.

my_table <- nice_table(
stats.table, short = TRUE, highlight = 0.001,
title = c("Table 1", "A Pretty Regression Model"),
note = c("The data was extracted from the 1974 Motor Trend US magazine.",

"Greyed rows represent statistically significant differences, p < .001."))

72 my_table

62

Table 1

A Pretty Regression Model

Parameter	b	t	df	p	β	95% CI (β)
(Intercept)	49.49	13.51	27	<.001	-0.18	[-0.36, -0.01]
cyl	-0.37	-0.72	27	.479	-0.11	[-0.42, 0.20]
wt	-7.63	-5.01	27	<.001	-0.62	[-0.85, -0.40]
hp	-0.11	-3.64	27	.001	-0.29	[-0.53, -0.04]
$wt \times hp$	0.03	3.23	27	.003	0.29	[0.11, 0.47]

Note. The data was extracted from the 1974 Motor Trend US magazine.

- Greyed rows represent statistically significant differences, p < .001.
- One can then easily save the resulting table to Word with flextable::save_as_docx(),
- ₇₅ specifying the object name and desired path.
- 76 flextable::save_as_docx(my_table, path = "nice_tablehere.docx")
- 77 Additionally, tables created with nice_table() are {flextable} objects (Gohel & Skintzos,
- ⁷⁸ 2022), and can be modified as such[2].

Formattting Results of Analyses

 $_{80}$ {rempsyc} also provides its own set of functions to prepare statistical tables before they can be $_{81}$ fed to nice_table() and saved to Word.

t tests

```
nice_t_test(data = mtcars,
response = c("mpg", "disp", "drat"),
group = "am",
warning = FALSE) |>
nice_table()
```

•	Dependent Variable	t	df	p	d	95% CI
	mpg	-3.77	18.33	.001	-1.48	[-2.27, -0.67]
	disp	4.20	29.26	<.001	1.45	[0.64, 2.23]
	drat	-5.65	27.20	<.001	-2.00	[-2.86, -1.12]

9 Contrasts

```
nice_contrasts(data = mtcars,
response = c("mpg", "disp"),
group = "cyl",
covariates = "hp") |>
nice_table(highlight = .001)
```

Dependent Variable	Comparison	df	t	p	d	95% CI
	4 - 8	28	3.66	.001	3.59	[2.73, 4.47]
mpg	6 - 8	28	1.29	.207	1.44	[0.77, 1.97]
	4 - 6	28	3.64	.001	2.15	[1.34, 3.05]
	4 - 8	28	-6.04	<.001	-4.80	[-5.80, -3.89]
disp	6 - 8	28	-4.86	<.001	-3.29	[-4.26, -2.28]
	4 - 6	28	-2.70	.012	-1.51	[-2.27, -0.90]

Regressions

```
model1 <- lm(mpg ~ cyl + wt * hp, mtcars)
model2 <- lm(qsec ~ disp + drat * carb, mtcars)
model2 <- lm(qsec ~ disp + drat * carb, mtcars)
nice_lm(list(model1, model2)) |>
nice_table(highlight = TRUE)
```

Dependent Variable	Predictor	df	b	t	p	sr^2	95% CI
	cyl	27	-0.37	-0.72	.479	.00	[0.00, 0.01]
mna	wt	27	-7.63	-5.01	<.001	.11	[0.01, 0.20]
mpg	hp	27	-0.11	-3.64	.001	.06	[0.00, 0.12]
	wt × hp	27	0.03	3.23	.003	.04	[0.00, 0.10]
	disp	27	-0.01	-1.97	.059	.07	[0.00, 0.20]
2222	drat	27	0.23	0.20	.845	.00	[0.00, 0.01]
qsec	carb	27	1.15	0.72	.479	.01	[0.00, 0.06]
_	$drat \times carb$	27	-0.48	-1.08	.289	.02	[0.00, 0.09]

Simple Slopes

104

	gear (HIGH-wt)	28	21.08	0.51	.616	.00	[0.00, 0.02]

Correlation Matrix

It is also possible to export a colour-coded correlation matrix to Microsoft Excel. The cormatrix_excel() function has several benefits over conventional approaches. The base R cor() function for example does not use rounded values and the console is impractical for large matrices. One may manually round values and export it to a .csv file, which is an improvement but still unsatisfying.

The {apaTables} package (Stanley & Spence, 2018) allows exporting the correlation matrix 117 to Word in an APA format, and in many cases this is very satifying for APA requirements. Hovever, the Word format is not suitable for large matrices, as it will often spread beyond the 119 document's margin limits. 120

Another approach is to export to an image, like the {correlation} package does (Makowski et 121 al., 2020). For very small matrices, this works extremely well, and the colour is an immense help to quickly identify which correlations are strong or weak, positive or negative, and significant 123 or non-significant. Again, however, this does not work so well for large matrices because labels 124 might overlap or navigating the large figure becomes difficult. 125

When the goal is more exploratory, rather than reporting, and we have large matrices, it can be more useful to export it to Excel. In {rempsyc}, we combine the idea of using a coloured 127 correlation matrix from the {correlation} package with the idea of exporting to Excel using 128 {openxlsx2} (Barbone & Garbuszus, 2023).

We also provide some quality of life-improvements, like freezing the first row and column so as 130 to be able to easily see which variables correlates with which other variable, regardless of how 131 far or deep those variables are located within the matrix.

The colour represents the strength of the correlation, whereas the stars represent how significant the p value is. [3] The exact p values are provided in a second tab for reference purposes, so all information is readily available in a convenient format.

```
cormatrix_excel(data = infert,
136
                     filename = "cormatrix1",
137
```

select = c("age", "parity", "induced", "case", "spontaneous",

Publication-Ready Figures

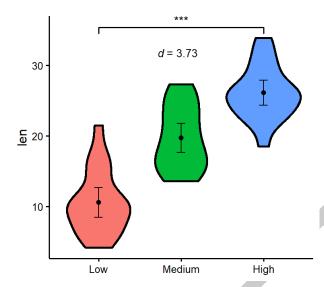

Preparing figures according to APA style, having them look good, and being able to save them in high-resolution with the proper ratios is often challenging. Working with {ggplot2} (Wickham, 2016) provides tremendous flexibility, but an unintended consequence is that doing even trivial operations can at times be daunting.

This is why {rempsyc} setups a few default plot types, ready to be saved to your preferred format (.pdf, .tiff, or .png).

Violin Plots

142

```
nice_violin(data = ToothGrowth,
group = "dose",
response = "len",
xlabels = c("Low", "Medium", "High"),
comp1 = 1,
comp2 = 3,
has.d = TRUE,
d.y = 30)
```

For an example of such use in publication, see Thériault et al. (2021).

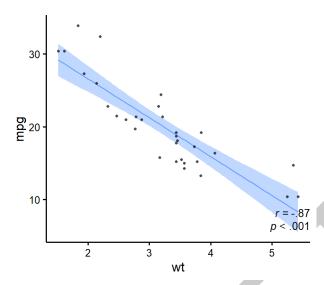

One can easily save the resulting figure with ggplot2::ggsave(), specifying the desired file name, extension, and resolution.

Recommended dimensions for saving {rempsyc} figures is 7 inches wide and 7 inches high at 300 dpi, which makes sure that the resolution is high enough even if saving to non-vector graphics formats like .png. That said, scalable vector graphics formats like .pdf or .eps are still recommended for high-resolution submissions to scientific journals. Additionally, figures are {ggplot2} objects (Wickham, 2016), and can be modified as such.

Scatter Plots

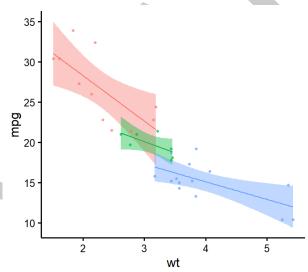

```
nice_scatter(data = mtcars,
predictor = "wt",
response = "mpg",
has.confband = TRUE,
has.r = TRUE,
has.p = TRUE)
```

```
nice_scatter(data = mtcars,
predictor = "wt",
response = "mpg",
group = "cyl",
has.confband = TRUE)
```

176

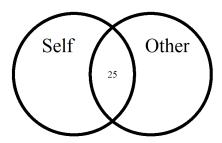

For an example of such use in publication, see Krol et al. (2020).

Overlapping Circles

For psychologists using the Inclusion of Other in the the Self Scale (Aron et al., 1992), it can be useful to interpolate the original discrete scores (1 to 7) into a group average representation of the conceptual self-other overlap.

overlap_circle(3.5)

For an example of such use in publication, see Thériault et al. (2021).

Testing assumptions

189

191

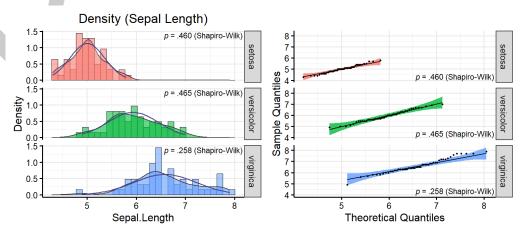

When comes time to test assumptions of a linear model, the best option is the check_model()
function from *easystats*' {performance} package, which allows direct visual evaluation of assumptions (Lüdecke et al., 2021). Indeed, visual assessment of diagnostic plots is recommended over statistical tests since they are overpowered in large samples and underpowered in small samples (Kozak & Piepho, 2018).

That said, if for whatever reason one wants to check objective asumption tests for a linear model, rempsyc makes this easy with the nice_assumptions() function, which provide *p* values for normality (Shapiro-Wilk), homoscedasticity (Breusch-Pagan) and autocorrelation of residuals (Durbin-Watson) in one call.

Categorical Predictors

nice_normality() makes it easy to visually check normality in the case of categorical predictors (i.e., when using groups), through a combination of quantile-quantile plots, density plots, and histograms.

```
nice_normality(data = iris,
variable = "Sepal.Length",
group = "Species",
shapiro = TRUE,
histogram = TRUE,
title = "Density (Sepal Length)")
```

```
Similarly for univariate outliers using the median absolute deviation (MAD, Leys et al., 2013).
    plot_outliers(airquality,
213
                    group = "Month",
214
                    response = "Ozone")
215
     Ozone (group-mean standardized)
        5.0
        2.5
        0.0
                         6
                                                    9
216
    Univariate outliers based on the MAD can also be simply requested with find_mad().[4]
217
    find_mad(airquality, names(airquality), criteria = 3)
218
219

Utility functions

260

261

263

Finally, with the idea of making the analysis workflow easier in mind, {rempsyc} also provides a few other utility functions. nice_na() allows reporting item-level missing values per scale, as well as participant's maximum number of missing items by scale, as per recommendations (Parent, 2013).

extract_duplicates() creates a data frame of only observations with a duplicated ID or participant number, so they can be investigated more thoroughly. best_duplicate() allows to follow-up on this investigation and only keep the "best" duplicate, meaning those with the fewer number of missing values, and in case of ties, the first one.

nice_reverse() permits the automatic reverse-coding of scores so common for psychology questionnaires, provided the minimum and maximum score values are known.

There are other functions that the reader can explore at their leisure on the package official website. However, hopefully, this overview has given the reader a gentle introduction to this package.

Availability

The {rempsyc} package is available on CRAN, and can be installed using install.packages("rempsyc").
The full tutorial website can be accessed at: https://rempsyc.remi-theriault.com/.

Acknowledgements

I would like to thank Hugues Leduc, Jay Olson, Charles-Étienne Lavoie, and Björn Büdenbender for statistical or technical advice that helped inform some functions of this package and/or useful feedback on this manuscript. I would also like to acknowledge funding from the Social Sciences and Humanities Research Council of Canada.
